The invention describes a polynucleotide sequence (I) encoding a CC Discosoma red fluorescent protein (DBRed) variant having a reduced CC propensity to oligomerise, comprising amino acid substitutions at the AB CC and/or AC interfaces of the wild-type DBRed sequence (SI) comprising 225 and/or AC interfaces of the wild-type DBRed sequence (SI) comprising 225 CC amino acids, given in the specification, where the substitutions result in reduced propensity of the DBRed variant to form tetramers. (I) is CC useful for detecting transcriptional activity by providing a host cells CC conatining a vector which comprises (I) operatively linked to an CC expression control sequence, and an unit to assay the variant fluorescent protein fluorescence, and assaying fluorescence of the variant CC fluorescence is indicative of transcriptional activity. A polynucleotide cencoding a fusion protein is useful for the analysis of in vivo CC localisation or trafficking of a polypeptide of interest. A polypeptide CC marker is useful as markers to identify the location and amount of a CC target protein produced, where the target protein and amount of a CC target protein variant, for detecting induction of transcriptions, in CC applications involving fluorescence energy resonance transfer (PRET), which detects events as the function of the movement of fluorescent contains an enzyme or away from each other, for making CC fluorescent sensors for protein kinase and phosphatase activities or indicators for ions and molecules such as Ca2+, Zn2+, for identifying the contains an enzyme or for determining the plot the sample. (I) is smalle contains an enzyme or for determining the plot the sample. (I) is
                                                          sample contains an enzyme or for determining the pH of the sample. (I) is useful for identifying a region or condition that regulates the activity of an expression control sequence. This sequence encodes Discosoma red
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Discosoma red fluorescent protein; DsRed; AB interface; AC in fluorescent protein variant; transcription induction detection fluorescence energy resonance transfer; FRET; protein kinase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel polynucleotide sequence encoding Discosoma red fluorescent protein variant having a reduced propensity to oligomerize, useful for detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  26-FEB-2001; 2001US-00794308.

The protein variant comprises one or more amino acid substitutions at the AB and/or AC interface(s) of the wild-type DsRed sequence, where the substitutions result in reduced propensity of the DsRed variant to form tetramers and where the variant displays detectable fluorescence of at least one red wavelength. The composition and methods are useful in producing red fluorescent proteins having reduced propensity for oligomerization, especially tetramerization. The protein may be used in molecular biology and in other scientific applications, such as in immunoassays or hybridization assays, or in tracking the movement of proteins in cells. This sequence corresponds to the DsRed variant more propersion of the composition of the composition of the composition of the protein may be used in molecular biology and in other scientific applications, such as in immunoassays or hybridization assays, or in tracking the movement of proteins in cells. This sequence corresponds to the DsRed variant more proteins in cells.

The fusion protein of the invention may be useful for analyzing the location or movement of a protein in cell in vivo and for labeling and analyzing the location or movement of intracellular organelles, such as mitochondria. The current sequence is that of the fluorescence-related enhanced green fluorescent protein (EGFP)-caspase-3 DEVD linker-mRFP(x2) fusion DNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 2241

CC fragments of a protein or mutant protein, where the fragments generate an optically detectable signal when associated, and each of the mutant CC protein fragments is fused to a separate molecule. Also described are: CC protein fragment sis fused to a separate molecule. Also described are: CC protein fragment complementation assays (PCAs) for detection of molecular interactions, involving reassembling separate fragments from an optically CC detectable protein, and detecting the reassembly by units of reconstitution of activity of the optically detectable protein, where the creassembly of the fragments is operated by the interaction of molecular CC domains fused to each fragment, and is independent of other molecular CC grocesses; detecting biomolecular interaction, involving selecting an CC optically detectable protein such that the fragmentation results in CC reversible loss of protein such that the fragmentation results in CC reversible loss of protein such that the fragmentation results of the optically detectable protein separately to other molecules, reassociating the protein fragments, and detecting the resulting optical CC signal, designing and engineering of PCAs based on fluorescent protein; and a method and composition for the construction of multi-color PCAs. CC (1) is useful in PCAs and other assays for drug discovery, target walldation, high-throughput screening, high-content screening, pathway of mapping, drug mechanism-of-action studies, biosensors and diagnostics. (1) is useful for engineering different colour PCAs for a variety of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       07-FEB-2000; 2000US-00499464.

The protein variant comprises one or more amino acid substitutions at the AB and/or AC interface(8) of the wild-type DSRed sequence, where the substitutions result in reduced propensity of the DBRed variant to form tetramers and where the variant displays detectable fluorescence of at least one red wavelength. The composition and methods are useful in producing red fluorescent proteins having reduced propensity for oligomerization, especially tetramerization. The protein may be used in molecular biology and in other scientific applications, such as in immunoassays or hybridization assays, or in tracking the movement of proteins in cells. This sequence corresponds to the DSRed variant mRFP1.1 coding sequence. The protein contains a Q66M and a T147S mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New monomeric and dimeric Anthozoan fluorescent protein variants with reduced propensity to oligomerize, and encoding polynucleotides, useful molecular biology, e.g. in immunoassays or in tracking protein movement in cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CDS

                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
